### Install or upgrade

### Prepare to install or upgrade the ONTAP Mediator service

To install the ONTAP Mediator service, you must ensure all prerequisites are met, get the installation package and run the installer on the host. This procedure is used for an installation or an upgrade of an existing installation.

- Beginning with ONTAP 9.7, you can use any version of ONTAP Mediator to monitor a MetroCluster IP configuration.
- Beginning with ONTAP 9.8, you can use any version of ONTAP Mediator to monitor an SM-BC relationship.

#### Before you begin

You must meet the following prerequisites.

| <b>ONTAP Mediator version</b> | Supported Linux versions  |
|-------------------------------|---|
| 1.6                           | <ul> <li>Red Hat Enterprise Linux: 8.4, 8.5, 8.6, 8.7, 9.0, 9.1</li> <li>Rocky Linux 8 and 9</li> </ul>                       |
| 1.5                           | <ul> <li>Red Hat Enterprise Linux: 7.6, 7.7, 7.8, 7.9, 8.1, 8.2, 8.3, 8.4, 8.5</li> <li>CentOS: 7.6, 7.7, 7.8, 7.9</li> </ul> |
| 1.4                           | <ul> <li>Red Hat Enterprise Linux: 7.6, 7.7, 7.8, 7.9, 8.1, 8.2, 8.3, 8.4, 8.5</li> <li>CentOS: 7.6, 7.7, 7.8, 7.9</li> </ul> |
| 1.3                           | <ul> <li>Red Hat Enterprise Linux: 7.6, 7.7, 7.8, 7.9, 8.1, 8.2, 8.3</li> <li>CentOS: 7.6, 7.7, 7.8, 7.9</li> </ul>           |
| 1.2                           | <ul> <li>Red Hat Enterprise Linux: 7.6, 7.7, 7.8, 8.1</li> <li>CentOS: 7.6, 7.7, 7.8</li> </ul>                               |

The kernel version must match the operating system version.

- · 64-bit physical installation or virtual machine
- 8 GB RAM
- · User: Root access

Any library packages except the kernel can safely be updated but might require a reboot to take affect within the ONTAP Mediator application. A service window is recommended when a reboot is required.

If you install the yum-utils package, you can use the needs-restarting command.

The kernel core can be updated if it is being updated to a version that is still supported by the ONTAP Mediator version matrix. A reboot will be mandatory, so a service window is required.

The SCST kernel module must be uninstalled prior to the reboot, then re-installed after the reboot.

Upgrading to a kernel beyond the supported OS release for the specific ONTAP Mediator release is not support. (This likely indicates that the tested SCST module won't compile).

# Upgrade the host operating system and then the ONTAP Mediator

To upgrade the host OS for ONTAP Mediator to a later version, you must first uninstall ONTAP Mediator.

#### Before you begin

The best practices for installing Red Hat Enterprise Linux or CentOS and the associated repositories on your system are listed below. Systems installed or configured differently might require additional steps.

- You must install Red Hat Enterprise Linux or CentOS according to Red Hat best practices. Due to end-of-life support for CentOS 8.x versions, compatible versions of CentOS 8.x are not recommended.
- While installing the ONTAP Mediator service on Red Hat Enterprise Linux or CentOS, the system must have access to the appropriate repository so that the installation program can access and install all the required software dependencies.
- For the yum installer to find dependent software in the Red Hat Enterprise Linux repositories, you must have registered the system during the Red Hat Enterprise Linux installation or afterwards by using a valid Red Hat subscription.

See the Red Hat documentation for information about the Red Hat Subscription Manager.

- The following ports must be unused and available for the Mediator:
  - · 31784
  - 。 3260
- If using a third-party firewall: refer to Firewall requirements for ONTAP Mediator
- If the Linux host is in a location without access to the internet, you must ensure that the required packages are available in a local repository.

If you are using Link Aggregation Control Protocol (LACP) in a Linux environment, you must correctly configure the kernel and make sure the sysctl net.ipv4.conf.all.arp ignore is set to "2".

#### What you'll need

The following packages are required by the ONTAP Mediator service:

|  | Additional packages for RHEL 9.x / Rocky Linux 9 |
|--|--|
|  | ,  |

- openssl
- · openssl-devel
- kernel-devel-\$ (uname -r)
- gcc
- make
- · libselinux-utils
- patch
- bzip2
- · perl-Data-Dumper
- perl-ExtUtils-MakeMaker
- · efibootmgr
- mokutil

- python3-pip
- · elfutils-libelf-devel
- · policycoreutils-python-utils
- · redhat-lsb-core
- python39
- python39-devel

- python3-pip
- · elfutils-libelf-devel
- · policycoreutils-python-utils
- python3
- python3-devel

The Mediator installation package is a self-extracting compressed tar file that includes:

- An RPM file containing all dependencies that cannot be obtained from the supported release's repository.
- · An install script.

A valid SSL certification is recommended.

#### About this task

When you upgrade the host OS for ONTAP Mediator to a later major version (for example, from 7.x to 8.x) using the leapp-upgrade tool, you must uninstall ONTAP Mediator because the tool tries to detect new versions of any RPMs that are installed in the repositories that are registered with the system.

Because an .rpm file was installed as part of the ONTAP Mediator installer, it is included in that search. However, because that .rpm file was unpacked as part of the installer and not downloaded from a registered repository, an upgrade cannot be found. In this case, the leapp-upgrade tool uninstalls the package.

In order to preserve the log files, which will be used to triage support cases, you should back up the files prior to doing an OS upgrade and restore them after a reinstall of the ONTAP Mediator package. Because the ONTAP Mediator is being reinstalled, any ONTAP Clusters that are connected to it will need to be reconnected after the new installation.

The following steps should be performed in order. Immediately after you reinstall ONTAP Mediator, you should stop the ontap\_mediator service, replace the log files, and restart the service. This will ensure logs will not be lost.

#### Steps

1. Back up the log files.

```
[rootmediator-host ~]# tar -czf ontap_mediator_file_backup.tgz -C
/opt/netapp/lib/ontap_mediator ./log
./ontap_mediator/server_config/ontap_mediator.user_config.yaml
[rootmediator-host ~]# tar -tf ontap_mediator_file_backup.tgz
./log/
./log/ontap_mediator.log
./log/scstadmin.log
./log/ontap_mediator_stdout.log
./log/ontap_mediator_requests.log
./log/install_20230419134611.log
./log/scst.log
./log/ontap_mediator_syslog.log
./log/ontap_mediator_syslog.log
./ontap_mediator/server_config/ontap_mediator.user_config.yaml
[rootmediator-host ~]#
```

2. Perform upgrade with leapp-upgrade tool.

```
[rootmediator-host ~]# leapp preupgrade --target 8.4
    ..<snip upgrade checks>..
    ..<fix issues found>..
[rootmediator-host ~]# leapp upgrade --target 8.4
    ..<snip upgrade>..
[rootmediator-host ~]# cat /etc/os-release | head -2
NAME="Red Hat Enterprise Linux"
VERSION="8.4 (Ootpa)"
[rootmediator-host ~]#
```

3. Reinstall ONTAP Mediator.

Perform the rest of the steps immediately after reinstalling ONTAP Mediator to prevent a loss of log files.

```
[rootmediator-host ~]# ontap-mediator-1.6.0/ontap-mediator-1.6.0

ONTAP Mediator: Self Extracting Installer

..<snip installation>..
[rootmediator-host ~]#
```

4. Stop the ontap\_mediator service.

```
[rootmediator-host ~]# systemctl stop ontap_mediator
[rootmediator-host ~]#
```

5. Replace the log files.

```
[rootmediator-host ~]# tar -xf ontap_mediator_log_backup.tgz -C
/opt/netapp/lib/ontap_mediator
[rootmediator-host ~]#
```

6. Start the ontap\_mediator service.

```
[rootmediator-host ~]# systemctl start ontap_mediator
[rootmediator-host ~]#
```

7. Reconnect all ONTAP clusters to the upgraded ONTAP Mediator

| Mediator IP   | Port   | Node  | Configurat  | ion                          |

#### **Procedure for SnapMirror Business Continuity**

For SnapMirror Business Continuity, if you installed your TLS certificate outside of the /opt/netapp directory, then you will not need to reinstall it. If you were using the default generated self-signed certificate or put your custom certificate in the /opt/netapp directory, then you should back it up and restore it.

```

### **Enable access to the repositories**

You should enable access to repositories so ONTAP Mediator can access the required packages during the installation process

#### **Steps**

1. Determine which repositories must be accessed, as shown in the following table:

| If your operating system is | You must provide access to these repositories |
|-----------------------------|---|
| RHEL 7.x                    | rhel-7-server-optional-rpms                   |
| RHEL 8.x                    | rhel-8-for-x86_64-baseos-rpms                 |
|                             | rhel-8-for-x86_64-appstream-rpms              |
| RHEL 9.x                    | • rhel-9-for-x86_64-baseos-rpms               |
|                             | • rhel-9-for-x86_64-appstream-rpms            |
| CentOS 7.x                  | C7.6.1810 - Base repository                   |
| Rocky Linux 8               | appstream                                     |
|                             | • baseos                                      |
| Rocky Linux 9               | • appstream                                   |
|                             | • baseos                                      |

2. Use one of the following procedures to enable access to the repositories listed above so ONTAP Mediator can access the required packages during the installation process.

Use this procedure if your operating system is **RHEL 7.x** to enable access to repositories:

#### Steps

1. Subscribe to the required repository:

```
subscription-manager repos --enable rhel-7-server-optional-rpms
```

The following example shows the execution of this command:

```
[root@localhost ~]# subscription-manager repos --enable rhel-7-server-optional-rpms
Repository 'rhel-7-server-optional-rpms' is enabled for this system.
```

2. Run the yum repolist command.

The following example shows the execution of this command. The "rhel-7-server-optional-rpms" repository should appear in the list.

```
[root@localhost ~]# yum repolist
Loaded plugins: product-id, search-disabled-repos, subscription-
manager
rhel-7-server-optional-rpms | 3.2 kB 00:00:00

#### Procedure for RHEL 8.x operating system

Use this procedure if your operating system is **RHEL 8.x** to enable access to repositories:

#### Steps

1. Subscribe to the required repository:

```
subscription-manager repos --enable rhel-8-for-x86_64-baseos-rpms subscription-manager repos --enable rhel-8-for-x86_64-appstream-rpms
```

The following example shows the execution of this command:

```
[root@localhost ~]# subscription-manager repos --enable rhel-8-for-x86_64-baseos-rpms

Repository 'rhel-8-for-x86_64-baseos-rpms' is enabled for this system.

[root@localhost ~]# subscription-manager repos --enable rhel-8-for-x86_64-appstream-rpms

Repository 'rhel-8-for-x86_64-appstream-rpms' is enabled for this system.
```

2. Run the yum repolist command.

The newly subscribed repositories should appear in the list.

#### Procedure for RHEL 9.x operating system

Use this procedure if your operating system is **RHEL 9.x** to enable access to repositories:

#### Steps

1. Subscribe to the required repository:

```
subscription-manager repos --enable rhel-9-for-x86_64-baseos-rpms subscription-manager repos --enable rhel-9-for-x86_64-appstream-rpms
```

The following example shows the execution of this command:

```
[root@localhost ~]# subscription-manager repos --enable rhel-9-for-
x86_64-baseos-rpms
Repository 'rhel-9-for-x86_64-baseos-rpms' is enabled for this system.
[root@localhost ~]# subscription-manager repos --enable rhel-9-for-
x86_64-appstream-rpms
Repository 'rhel-9-for-x86_64-appstream-rpms' is enabled for this system.
```

2. Run the yum repolist command.

The newly subscribed repositories should appear in the list.

Use this procedure if your operating system is **CentOS 7.x** to enable access to repositories:

The following examples are showing a repository for CentOS 7.6 and might not work for other CentOS versions. Use the base repository for your version of CentOS.

#### Steps

- 1. Add the C7.6.1810 Base repository. The C7.6.1810 Base vault repository contains the "kernel-devel" package needed for ONTAP Mediator.
- 2. Add the following lines to /etc/yum.repos.d/CentOS-Vault.repo.

```
[C7.6.1810-base]
name=CentOS-7.6.1810 - Base
baseurl=http://vault.centos.org/7.6.1810/os/$basearch/
gpgcheck=1
gpgkey=file:///etc/pki/rpm-gpg/RPM-GPG-KEY-CentOS-7
enabled=1
```

3. Run the yum repolist command.

The following example shows the execution of this command. The CentOS-7.6.1810 - Base repository should appear in the list.

```
Loaded plugins: fastestmirror
Loading mirror speeds from cached hostfile
 * base: distro.ibiblio.org
 * extras: distro.ibiblio.org
 * updates: ewr.edge.kernel.org
C7.6.1810-base

[root@localhost ~]#
```

#### Procedure for Rocky Linux 8 or 9 operating systems

Use this procedure if your operating system is **Rocky Linux 8** or **Rocky Linux 9** to enable access to repositories:

#### **Steps**

1. Subscribe to the required repositories:

```
dnf config-manager --set-enabled baseos
dnf config-manager --set-enabled appstream
```

2. Perform a clean operation:

```
dnf clean all
```

3. Verify the list of repositories:

```
dnf repolist
```

#### **Example for Rocky Linux 8**

#### **Example for Rocky Linux 9**

### Download the Mediator installation package

Download the Mediator installation package as part of the installation process.

#### **Steps**

1. Download the Mediator installation package from the ONTAP Mediator page.

**ONTAP** Mediator download page

2. Confirm that the Mediator installation package is in the current working directory:

ls

```
[root@mediator-host ~] #1s ontap-mediator-1.5.0.tgz
```

For ONTAP Mediator versions 1.4 and earlier, the installer is named ontap-mediator.

If you are at a location without access to the internet, you must ensure that the installer has access to the required packages.

- 3. If necessary, move the Mediator installation package from the download directory to the installation directory on the Linux Mediator host.
- 4. Unzip the installer package:

```
tar xvfz ontap-mediator-1.6.0.tgz
```

```
[root@scs000099753 ~] # tar xvfz ontap-mediator-1.6.0.tgz ontap-mediator-1.6.0/
ontap-mediator-1.6.0/ONTAP-Mediator-production.pub
ontap-mediator-1.6.0/tsa-prod-chain-ONTAP-Mediator.pem
ontap-mediator-1.6.0/tsa-prod-ONTAP-Mediator.pem
ontap-mediator-1.6.0/csc-prod-ONTAP-Mediator.pem
ontap-mediator-1.6.0/csc-prod-chain-ONTAP-Mediator.pem
ontap-mediator-1.6.0/ontap-mediator-1.6.0
ontap-mediator-1.6.0/ontap-mediator-1.6.0.sig.tsr
ontap-mediator-1.6.0/ontap-mediator-1.6.0.tsr
ontap-mediator-1.6.0/ontap-mediator-1.6.0.sig
```

### Verify the ONTAP Mediator code signature

You should verify the ONTAP Mediator code signature before installing the Mediator installation package.

#### Before you begin

Before verifying the Mediator code signature, your system must meet the following requirements.

- openssl versions 1.0.2 to 3.0 for basic verification
- openssl version 1.1.0 or later for Time Stamping Authority (TSA) operations
- Public internet access for OCSP verification

#### The following files are included in the download package:

| File                              | Description   |
|-----------------------------------|---|
| ONTAP-Mediator-development.pub    | The public key used to verify the signature   |
| csc-prod-chain-ONTAP-Mediator.pem | The public certification CA chain of trust  |
| csc-prod-ONTAP-Mediator.pem       | The certificate used to generate the key  |
| ontap-mediator-1.6.0              | The product installation executable for version 1.6.0                                   |
| ontap-mediator-1.6.0.sig          | The SHA-256 hashed, then RSA-signed using the csc-prod key, signature for the installer |
| ontap-mediator-1.6.0.sig.tsr      | The revocation request for use by OCSCP for the installer's signature                   |
| tsa-prod-ONTAP-Mediator.pem       | The public certificate for the TSR  |
| tsa-prod-chain-ONTAP-Mediator.pem | The public certificate CA Chain for the TSR   |

#### **Steps**

- 1. Perform the revocation check on csc-prod-ONTAP-Mediator.pem by using Online Certificate Status Protocol (OCSP).
  - a. Find the OCSP URL used to register the certificate because developer certificates might not provide a uri.

```
openssl x509 -noout -ocsp_uri -in csc-prod-chain-ONTAP-Mediator.pem
```

b. Generate an OCSP request for the certificate.

```
openssl ocsp -issuer csc-prod-chain-ONTAP-Mediator.pem -CAfile csc-prod-chain-ONTAP-Mediator.pem -cert csc-prod-ONTAP-Mediator.pem -reqout req.der
```

c. Connect to the OCSP Manager to send the OCSP request:

openssl ocsp -issuer csc-prod-chain-ONTAP-Mediator.pem -CAfile csc-prod-chain-ONTAP-Mediator.pem -cert csc-prod-ONTAP-Mediator.pem -url \${ocsp\_uri} -resp\_text -respout resp.der -verify\_other csc-prod-chain-ONTAP-Mediator.pem

2. Verify the trust chain of the CSC and expiration dates against the local host:

openssl verify

The openss1 version from the PATH must have a valid cert.pem (not self-signed).

openssl verify -untrusted csc-prod-chain-ONTAP-Mediator.pem -CApath \${OPENSSLDIR} csc-prod-ONTAP-Mediator.pem # Failure action: The Code-Signature-Check certificate has expired or is invalid. Download a newer version of the ONTAP Mediator.

openssl verify -untrusted tsa-prod-chain-ONTAP-Mediator.pem -CApath \${OPENSSLDIR} tsa-prod-ONTAP-Mediator.pem # Failure action: The Time-Stamp certificate has expired or is invalid. Download a newer version of the ONTAP Mediator.

3. Verify the ontap-mediator-1.5.0.sig.tsr and ontap-mediator-1.6.0.tsr files using the associated certificates:

openssl ts -verify

.tsr files contain the time stamp response associated with the installer and the code signature. Processing confirms that the time stamp has a valid signature from TSA and that your input file has not changed. The verification is performed locally on your machine. Independently, there is no need to access TSA servers.

openssl ts -verify -data ontap-mediator-1.6.0.sig -in ontap-mediator-1.6.0.sig.tsr -CAfile tsa-prod-chain-ONTAP-Mediator.pem -untrusted tsa-prod-ONTAP-Mediator.pem

openssl ts -verify -data ontap-mediator-1.6.0 -in ontap-mediator-1.6.0.tsr -CAfile tsa-prod-chain-ONTAP-Mediator.pem -untrusted tsa-prod-ONTAP-Mediator.pem

4. Verify signatures against the key:

openssl -dgst -verify

openssl dgst -sha256 -verify ONTAP-Mediator-production.pub -signature ontap-mediator-1.6.0.sig ontap-mediator-1.6.0

```
[root@scspa2695423001 ontap-mediator-1.6.0]# pwd

### Install the ONTAP Mediator installation package

To install the ONTAP Mediator service, you must get the installation package and run the installer on the host.

#### About this task

- Beginning with ONTAP Mediator 1.4, the Secure Boot mechanism is enabled on UEFI systems. When Secure Boot is enabled, you must take additional steps to register the security key after installation:
  - Follow instructions in the README file to sign the SCST kernel module.:

```
/opt/netapp/lib/ontap_mediator/ontap_mediator/SCST_mod_keys/README.module-
signing
```

Locate the required keys:

/opt/netapp/lib/ontap mediator/ontap mediator/SCST mod keys

After installation, the README files and key location are also provided in the system output.

#### **Steps**

- 1. Run the installer and respond to the prompts as required:
  - ./ontap-mediator-1.6.0/ontap-mediator-1.6.0 -y

```
[root@scs000099753 ~]# ./ontap-mediator-1.5.0/ontap-mediator-1.6.0 -y
```

The installation process proceeds to create the required accounts and install required packages. If you have a previous version of Mediator installed on the host, you will be prompted to confirm that you want to upgrade.

```
[root@scs000099753 ~]# ./ontap-mediator-1.6.0/ontap-mediator-1.6.0 -y
ONTAP Mediator: Self Extracting Installer
+ Extracting the ONTAP Mediator installation/upgrade archive
+ Performing the ONTAP Mediator run-time code signature check
  Using openssl from the path: /usr/bin/openssl configured for
CApath:/etc/pki/tls
+ Unpacking the ONTAP Mediator installer
ONTAP Mediator requires two user accounts. One for the service
(netapp), and one for use by ONTAP to the mediator API (mediatoradmin).
Using default account names: netapp + mediatoradmin
Enter ONTAP Mediator user account (mediatoradmin) password:
Re-Enter ONTAP Mediator user account (mediatoradmin) password:

Complete!
OS package installations finished
+ Installing ONTAP Mediator. (Log: /tmp/ontap mediator.JixKGP/ontap-
mediator-1.6.0/ontap-mediator-1.6.0/install 20221021155929.log)
    This step will take several minutes. Use the log file to view
progress.
    Sudoer config verified
    ONTAP Mediator rsyslog and logging rotation enabled
+ Install successful. (Moving log to
/opt/netapp/lib/ontap mediator/log/install 20221021155929.log)
+ WARNING: This system supports UEFI
           Secure Boot (SB) is currently disabled on this system.
           If SB is enabled in the future, SCST will not work unless
the following action is taken:
           Using the keys in
/opt/netapp/lib/ontap mediator/ontap mediator/SCST mod keys follow
           instructions in
/opt/netapp/lib/ontap mediator/ontap mediator/SCST mod keys/README.modu
le-signing
           to sign the SCST kernel module. Note that reboot will be
```

```
needed.

SCST will not start automatically when Secure Boot is enabled and not configured properly.

+ Note: ONTAP Mediator uses a kernel module compiled specifically for the current

OS. Using 'yum update' to upgrade the kernel might cause service interruption.

For more information, see /opt/netapp/lib/ontap_mediator/README

[root@scs000099753 ~]# cat /etc/redhat-release

Red Hat Enterprise Linux release 8.5 (Ootpa)

[root@scs000099753 ~]#
```

### Verify the installation

After the ONTAP Mediator has been installed, you should verify that the ONTAP Mediator services are running.

#### **Steps**

- 1. View the status of the ONTAP Mediator services:
  - a. systemctl status ontap mediator

```
[root@scspr1915530002 ~]# systemctl status ontap mediator
ontap mediator.service - ONTAP Mediator
Loaded: loaded (/etc/systemd/system/ontap mediator.service; enabled;
vendor preset: disabled)
Active: active (running) since Mon 2022-04-18 10:41:49 EDT; 1 weeks 0
days ago
Process: 286710 ExecStop=/bin/kill -s INT $MAINPID (code=exited,
status=0/SUCCESS)
Main PID: 286712 (uwsgi)
Status: "uWSGI is ready"
Tasks: 3 (limit: 49473)
Memory: 139.2M
CGroup: /system.slice/ontap mediator.service
      -286712 /opt/netapp/lib/ontap_mediator/pyenv/bin/uwsgi --ini
/opt/netapp/lib/ontap mediator/uwsgi/ontap mediator.ini
      ├-286716 /opt/netapp/lib/ontap mediator/pyenv/bin/uwsqi --ini
/opt/netapp/lib/ontap mediator/uwsgi/ontap mediator.ini
      -286717 /opt/netapp/lib/ontap mediator/pyenv/bin/uwsgi --ini
/opt/netapp/lib/ontap mediator/uwsgi/ontap mediator.ini
[root@scspr1915530002 ~]#
```

b. systemctl status mediator-scst

2. Confirm the ports that are used by the ONTAP Mediator service:

netstat

```
[root@scspr1905507001 ~]# netstat -anlt | grep -E '3260|31784'

tcp 0 0 0.0.0.0:31784 0.0.0.0:* LISTEN

tcp 0 0 0.0.0.0:3260 0.0.0.0:* LISTEN

tcp6 0 0 :::3260 :::* LISTEN
```

### Post-installation configuration

After the ONTAP Mediator service is installed and running, additional configuration tasks must be performed in the ONTAP storage system to use the Mediator features:

- To use the ONTAP Mediator service in a MetroCluster IP configuration, see Configuring the ONTAP Mediator service from a MetroCluster IP configuration.
- To use SnapMirror Business Continuity, see Install ONTAP Mediator Service and confirm the ONTAP cluster configuration.

### **Configure ONTAP Mediator security policies**

The ONTAP Mediator server supports several configurable security settings. The default values for all settings are provide in a low\_space\_threshold\_mib: 10read-only file:

/opt/netapp/lib/ontap\_mediator/server\_config/ontap\_mediator.user\_config.yaml

All values that are placed in the <code>ontap\_mediator.user\_config.yaml</code> will override the default values and be maintained across all ONTAP Mediator upgrades.

After you modify ontap mediator.user config.yaml, restart the ONTAP Mediator service:

```
systemctl restart ontap_mediator
```

The following attributes can be configured: NOTE: Other default values in the ontap mediator.config.yaml should not be modified.

 Settings used to install third-party SSL certificates as replacements for the default self-signed certificates

```
cert path:
'/opt/netapp/lib/ontap mediator/ontap mediator/server config/ontap media
tor server.crt'
key path:
'/opt/netapp/lib/ontap mediator/ontap mediator/server config/ontap media
tor server.key'
ca cert path:
'/opt/netapp/lib/ontap mediator/ontap mediator/server config/ca.crt'
ca key path:
'/opt/netapp/lib/ontap mediator/ontap mediator/server config/ca.key'
ca serial path:
'/opt/netapp/lib/ontap mediator/ontap mediator/server config/ca.srl'
cert valid days: '1095'
                                          # Used to set the expiration
on client certs to 3 years
x509 passin pwd: 'pass:ontap'
                                         # passphrase for the signed
client cert
```

· Settings that provide protections against brute-force password guessing attacks

To enable the feature, set a value for the window seconds and the retry limit

#### Examples:

• Provide a 5-minute window for guesses, and then reset the count to zero failures:

```
authentication lock window seconds: 300
```

• Lock the account if five failures occur within the window timeframe:

```
authentication retry limit: 5
```

 Reduce the impact of brute-force password guessing attacks by setting a delay that occurs prior to rejecting each attempt, which slows the attacks.

```
authentication failure delay seconds: 5
```

```
authentication_failure_delay_seconds: 0  # seconds (float) to delay failed auth attempts prior to response, 0 = no delay authentication_lock_window_seconds: null  # seconds (int) since the oldest failure before resetting the retry counter, null = no window authentication_retry_limit: null  # number of retries to allow before locking API access, null = unlimited
```

• Fields that control the password complexity rules of the ONTAP Mediator API user account

```
password_min_length: 8

password_max_length: 64

password_uppercase_chars: 0  # min. uppercase characters

password_lowercase_chars: 1  # min. lowercase character

password_special_chars: 1  # min. non-letter, non-digit

password_nonletter_chars: 2  # min. non-letter characters (digits, specials, anything)
```

• Setting that controls the required free space on the /opt/netapp/lib/ontap\_mediator disk.

If the space is lower than the set threshold, the service will issue a warning event.

```
low_space_threshold_mib: 10
```
